15 MARYLAND AND DELAWARE SECTION

G. N. BRANCATO

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. L BALTIMORE, MD., YEAR 1946 No. 13

GENERAL SUMMARY

The year 1946 was the sixth consecutive one with above normal temperature. The mean temperature was 55.8° , 1.9° above normal, which was only 0.1° below the record warm years of 1913 and 1931. All the significant above normal departures occurred in the first three and last three months of the year, and the larger minus departures from the normal occurred in the summer months. The Summer was 1.8° cooler than normal, while the Winter was 3.2° above normal. Both Spring and Autumn were slightly more than 2° warmer than normal. There were no excessively hot periods during the Summer, the highest temperature recorded being 99° , and temperatures this high occurred at only a few stations in July. The last 52 years have had six occasions when temperatures in Maryland failed to reach 100° ; the last year in which it failed to reach 100° being 1928. Temperatures of 100° or higher occur in Delaware in only about two out of three years due to the influence of the Ocean and Chesapeake Bay.

There were only two excessively cold periods during the year, the first between January 20-24, when the temperature in western counties dipped well below zero. However, the coldest temperature recorded, 16° below zero at Oakland, was 24° above the record low for the location. The second coldest period came early in December when most stations reported temperatures between zero and twenty degrees above zero. The highest mean temperature for the year was 61.7° at Crisfield, Maryland, and the lowest was 48.5° at Sines, Maryland. However, the mean temperature at most stations was in the fifties.

After two years with above normal precipitation, 1944 being only slightly above normal and 1945 being the second wettest year on record, 1946 was a little on the dry side. The average precipitation for the section was 37.5 inches, or 4.39 inches below normal. However, the distribution of precipitation with regard to area and the frequency of occurrences, was favorable throughout the year. The first four months were below normal with the average fall about 14 inches lower than usual. May was the second wettest on record, being only 0.4 inch lower than the all-time May record of 6.44 inches. During this month thunderstorms were frequent and the rain was well distributed over most sections and throughout the month. From June through October, the season when crops were developing, near normal rainfall occurred in all months, the five-month period receiving only 0.16 inch less than normal. Total rainfall for the year varied from 46.12 inches at Lewes, Delaware, to 24.63 inches at Annapolis. The greatest twenty-four rainfall during the year was 5.70 inches at Unionville, Maryland, on June 1-2.

In the fifty-one years of record, only three have had less snow than fell during 1946. The average fall of 14.0 inches was 12.2 inches or 47% below the amount which usually falls over this section. All winter months were deficient in snowfall. The pronounced deficiency occurred in March when an average of 0.1 inch of snow fell, which was 4.7° inches below normal. This equals the lowest record which occurred in only three other years, namely, 1918, 1921, and 1928. Total amounts for the year varied from a total of $\frac{1}{2}$ inch at Crisfield, Maryland to 43.4 inches at Oakland, Md. The greatest twenty-four hour snowfall was 14.0 inches at Frostburg, Maryland, on February 19-20.

On the whole, this was a very good year for crops. The first four months were dry, but there was ample soil moisture due to above normal precipitation in November and December of the preceding year. Grains and grasses were generally green and made some growth during the winter. In January the monthly mean temperature was 1.9° above normal and the average precipitation for the section was about 50% of normal. In February the mean temperature was 3.4° above normal and the precipitation about 80% of normal. Warm weather continued through March with the mean temperature, 56.7° being the third highest March on record. As a result of the unusual warmth, especially during March, all vegetation was two to three weeks ahead of the season. Grains and grasses were green and growing well. At the close of March, except in the Allegheny Mountain region, tree fruit buds were swelling, and in some cases were blossoming.

With April near normal in temperature and with sufficient but below normal rainfall in central and northern counties, vegetation continued two to three weeks ahead of the

(Continued at bottom of page 50).

CONDENSED SUMMARY OF CLIMATOLOGICAL DATA 1946

Months	Temperature		Precipitation		Number of days		Prevailing direction of wind

Post Office addresses of these stations are as follows: Of Bell, Glenndale; of Blackwater, Cambridge; of Charlotte Hall, Mechanicsville; of Coleman, Worton; of Ferry Landing, Owings; of Great Falls, Bethesda; of Picardy, Paw Paw, W. Va.; of Pretty boy Dam, Parkton; of Sines, Oakland; of Tonoloway, Hancock. Municipal Bldg. Porter Reservoir. * Determined from surrounding stations.

(Continued from preceding page)
season. Wheat, barley, and rye were beginning to head in eastern and southern counties near the end of the month. Fruit blossoms were damaged some by the freeze and frost on the 11-13, and were more heavily damaged on the 18th in the interior Eastern Shore sections. In Western Maryland freezing temperatures damaged fruit blossoms again on

While May was wet and windy with normal temperature, the rainfall was well distributed throughout the month and over the section. Vegetation and crops damaged by the frost and freezing weather improved considerably. Planting of truck crops and gardens was well advanced in all sections by the end of the month. Wheat, rye, and barley were heading or headed as far west as Washington County, and had a nice green color in

western counties. Oats were heading and early planted corn was up to a good stand. Tree fruits were developing.

June with normal rainfall and slightly below normal temperatures saw the continuation of very good crop development. At the close of the month, wheat and rye were ripening or ripe except in the mountain region. Barley was being threshed and oats were ripening or ripened over most central and southern counties. In northern counties oats were heading. Crops, grasses and pastures were good to excellent. Potatoes were growing well and tomatoes were developing fruit. Early tree fruits were ripening and were being picked by the end of the month.

Near normal rainfall and slightly below normal temperatures in July produced very
(Continued at bottom of next page).

good crop development during the month. Harvesting of grains was in full swing. Gardens, grasses, and pastures remained good to excellent. Many early garden crops were being harvested, but a late tomato blight was appearing. Tree fruits were ripened and were being picked.

In spite of an August which was three degrees cooler than normal, most
