Introduction

The Delaware Population Consortium (DPC) is pleased to continue its program of providing 30-year population and employment projections for the State, the counties, and for selected municipalities. These projections incorporate new information that has been provided to or generated by DPC members and other agencies at the federal, state, and local level.

The document is divided into three sections following some introductory text. Section A contains the latest version of the population projections. The projections reflect a slight decrease in the total population over last year's, largely because of a major review of net migration (see *Notes* on page 9) and benchmarking to the Census Bureau's 1999 estimates. These data also incorporate the actual births and deaths since 1990. Section B contains the ever popular "population pyramids" that display in easily digestible fashion, the complexity of the tables found in Section A. Section C includes illustrative population projections by race for the City of Wilmington. Finally, Section D contains total household and population projections for Census County Divisions (CCD's).

In 1997, the DPC began releasing projections and estimates on special topics that are of interest to policy-makers, planners, and the general public but are only indirectly related to the annual projections. The DPC plans to continue to release such projections and estimates in the future, including an updated set of estimates for Delaware's Hispanic population. As in past years, these special topics will be released as independent documents.

History

There were many generators of population projections prior to the founding of the Delaware Population Consortium in 1975. Every new state or local jurisdiction's capital project or proposed program seemed to generate a new set of projections. Few were comprehensive in content or geographical coverage. Most studies provided only state-wide, or at best county-wide coverage. While other studies were localized to perhaps a single school district or a sewer district. Often, projection series were developed to deal with specific issues. Examples include projections of elderly populations, or school age children or simply the number of households.

The projections were rarely produced with standard methodologies. There was no assurance that common and nationally recognized techniques were used when forecasting and projecting. Methodologies ranged from build-out scenarios based on existing zoning to straight line projection of past trends. Frequently, they were then arbitrarily adjusted for "local factors".

The resulting projections were inconsistent. This is illustrated in six governmental reports, dealing with comprehensive development planning and population change in New Castle County. Those studies were done from the late 1950's to the late 1960's. The 1980 US Census found 398,115 persons living in New Castle County. Interest groups projected population for 1980 as follows : In 1958, the county Planning Commission projected 512,900 persons; The New Castle County Program (1964) (an intergovernmental planning group) projected 672,000 persons; The State of Delaware, Planning Office (1966) projected 670,000 (1985); University of Delaware, Cooperative extension Service (1966) projected 478,000; and The New Castle County, Department of Planning (1967) 582,000.

Each projection series was unique with respect to its starting and ending points. There was no system to evaluate the results over time or of updating them. Many studies were done by consultants and their involvement ended with the completion of a contract.

The release of population and other counts from the 1970 US Census, raised concerns for both the accuracy of population projections, in general, and the lack of knowledge about the nature of the assumptions that were being used at the time.

"The Delaware Population Consortium was formed during August 1975, with the goal of providing a continuing forum for debate and discussion of matters relating to state and local population growth."(*Delaware Population Growth, 1975: UofD, Division of Urban Affairs.*) Under

the sponsorship of the State Planning Office, parties interested in a common set of reliable projections were brought together. They called themselves the Delaware Population Consortium (DPC). Although the State Planning Office provided sponsorship and technical support, direction was by consensus of the participants. The initial report was prepared by the University of Delaware's Division of Urban Affairs. This was done under contract with the State Planning Office and was financed through a comprehensive planning grant from the US Department of Housing and Urban Development.

The original core members of the DPC were from several departments of State government, the three counties, the Cities of Newark and Wilmington, WILMAPCO (the federally designated metropolitan planning organization for transportation) and the 208 Aerated Waste Treatment Management Program with technical and methodological assistance provided by the University of Delaware. In time, the program and the DPC membership has grown to include statewide representation from private utilities, citizens' groups, non-profit organizations, community and business interests.

The DPC effort is guided by a set of objectives. They were developed early on and have been virtually unchanged over the last 20 years. They include:

1. A ***single set of projections*** , in the public domain, to be widely disseminated to all users of demographic data.
2. A ***long term horizon of thirty years*** with data provided at five-year intervals and annually for selected years. The starting point is the most recent year of the United States Census.
3. A ***single methodology*** to be utilized and fine-tuned over time.
4. A ***regular annual release date*** during the month of January of each year to ensure a predictable flow of information around which policy and decision-making can be built or monitored.
5. On-going ***review and update*** as required.
6. Projections for a ***consistent set of geographic areas*** including the State, each county, Wilmington, Dover and Newark.

The DPC is an informal organization. Its structure consists of the Committee-of-the-Whole, a technical or steering committee, administrative support staff, and technical support staff.

The Committee-of-the-Whole is composed of any group or persons who have an interest in demographic projections. As a result, the composition of the committee-of-the-whole is never exactly the same from year to year. The Committee-of-the-Whole usually meets only for the annual, January meeting. Its role is to comment on and adopt a projection series recommended by the steering committee.

The steering committee is composed of a core committee of professional demographers, planners, analysts and economists and other interested persons. Its role is to gather, monitor and analyze relevant information about changes in births, deaths, migration and employment.

Staffing is provided by volunteers, elected from the Committee-of-the-Whole. The organization is governed by a set of by-laws. The two operating officers are the Chair and Vice-chair. Day-to-day administrative support is provided by the staff of Delaware Economic Development Office.

The steering committee includes participants from the University of Delaware's Center for Applied Demographic and Survey Research, the marketing division of Delmarva Power who maintain an econometric model for Delaware and the region, the labor analysis section of the State Department of Labor, the Delaware Health Statistics Center of the State Department of Health and Social Services, the Office of Occupational and Labor market Information of the State Department of Labor, and members from the county planning departments, WILMAPCO, and DELDOT.

The process used by DPC to produce an annual projection series is straightforward and is tied to releases of information throughout the calendar year. The previous year's projection series is evaluated against the annual July US Census estimates. Any significant changes or newly recognized trends are identified by the Technical Committee.

The steering committee deliberates and then produces a draft report in tabular form. The draft and revisions are produced during the Fall months. The draft is then distributed to the members of the Committee-of-the-Whole, based on the last annual meetings attendance, as well as any interested party.

The annual meeting is held in July where the product and methodology are reviewed. At this time there is discussion of next year's product which can include any changes or refinements in the content of the projections or inclusion of significant events that might influence the base data and assumptions.

Methodology

The projection process begins with the 1990 age-sex distribution (obtained from the US Bureau of Census) for the jurisdiction being projected. This distribution is comprised of eighteen separate age cohorts beginning with the five-year age group 0-4 and ending with the 85-and-over age group. These projections utilize the modified age-race-sex (MARS) estimates produced during 1994 to correct certain flaws in the estimates prepared by the Census Bureau in 1990.

The first step in the projection process is applying the appropriate survival rates to each five-year age-sex cohort. A five-year survival rate is used to account for mortality and each age group has its own unique survival rate. Applying the appropriate survival rate to the 0-4 age group, for example, yields the likely number of those persons alive in that age group in 1990 that will survive to enter the 5-9 age group in 1995. This procedure is followed until all age groups have been survived with the exception of the birth cohort (ages 0-4 in 1995).

The 0-4 age group in 1995 is formed from all of those persons born during the 1990-1995 period. This is estimated by applying an annual birth rate for females in each separate age group beginning with 10-14 and ending with 45-49. For example, if the five-year fertility rate for females of ages 30-34 is multiplied by the number of females in that age group in the base year, the result is the likely number of births for those females over the five-year projection period. This is done for all relevant age groups and the estimates are summed to produce the new birth cohort. The birth cohort is then survived to 1995. This procedure can then be applied for each subsequent time period 1995-2000, 2000-2005, and so on. The end result of this two step process is a projection of population growth due solely to natural increase (i.e., zero net-migration). Unfortunately, this is rarely the case, and net migration must be estimated.

The conventional procedure used to adjust the projections for net-migration is to calculate a migration rate for each age-sex category for some past time period e.g. 1985-1990, and to make assumptions about how those rates will change in the future. This procedure can work well if the migration rates from the reference period (1985-1990) reflect the future. If the nature of migration is changing, the result will probably be unsatisfactory. The rapid change in migration during the 1980's stands in stark contrast to that of the 1970's. For that reason, and the need to integrate employment projections with the population projections, another method is used to estimate migration (see *Migration* on page 8).

Mortality.

The mortality rates currently used are based on age-by-sex, five-year survival rates calculated from deaths of Delaware residents from 1988-1992 and the underlying population for each cohort in 1990. Using these rates as a starting point, the rates are scaled proportionally to produce the estimated number of deaths 1991-1995 using actual deaths through 1995. In addition, actual deaths for 1996-1999 and the estimated deaths for 2000 were allowed to influence the 2000 projection. This scaling procedure was followed separately for the State and each of the counties, resulting in a slightly different set of mortality assumptions for each.

Fertility.

The assumptions for fertility rates were derived using births to Delaware residents from 1988-1992 and the underlying female population groups from 1990. Using these as a base, the rates are scaled proportionally to produce the estimated number of births 1991-1995 using actual births through 1995. Following the same procedures as in mortality above, actual births in 1996-1999 and estimated births in 2000 were allowed to influence the 2000 projection. This scaling procedure was followed separately for the State and each of the counties, resulting in a slightly different set of fertility assumptions for each.

Labor-force.

In order to balance the employment forecast with the population projections, resident employment is calculated. This calculation requires a number of assumptions. The first set of assumptions are taken from the Bureau of Labor Statistics (BLS). BLS provides the current and projected labor-force participation rates for each age-sex cohort from 1995 through 2020. Applying these rates allows the derivation of a theoretical labor-force. An unemployment rate is then applied to that theoretical labor-force. That rate is the same as the one used in generating the employment forecasts. The result of this calculation is employment by place of residence. Resident jobs is derived from employment by place of residence by making adjustments for self-employment, agricultural jobs, and multiple job-holders.

The Delaware Department of Labor's estimates and forecasts are used to establish the starting point from the employment side. To generate an estimate for resident jobs from the employment forecasts, a single adjustment is required. Net commuting (i.e., in-commuters less out-commuters) is used to adjust the employment forecast. In addition, we were able to use the 1990 County-to-County Journey-to-Work data from the 1990 Census Transportation Planning Package are used.

Migration.

Employment (i.e., number of jobs) is usually forecast using an economic model as opposed to a demographic model. It is assumed that there will be a sufficient number of persons to fill those jobs. If the projected population due to natural increase is too low, then net in-migration is required to fill the jobs. Alternatively, if the projected population is too high, net out-migration will occur. In either case, the migration rates from the reference year are modified proportionally to produce sufficient net migration to allow the employment forecasts and the population projection to balance. The final amount of net migration is an output of the calculation. If that estimate seems too high then adjustments must be made to the employment forecasts or to one of the other assumptions in the labor-force estimate.

Adjustments.

Projecting population is a risky business and is dependent on the quality of the assumptions, and those can change from year to year as better data becomes available. Thus, it is imperative that the projections be reviewed annually. This report is the result of the Consortium's continuing monitoring and review process.

There are data which can be used to adjust the path of the projection without going through a major revision. First, the annual population estimates (not forecasts) provided by the Federal-State-Local cooperative are useful for monitoring the total population. Second, actual birth and death statistics issued by National Center for Health Statistics and the Delaware Health Statistics Center are quite valuable. Third, school enrollment data, estimated migration from the Bureau of Census and the IRS, Medicare enrollment data from HCFA, and the Current Population Survey can help with structural changes in the age groups. Finally, data from the Department of Labor tracks changes in employment growth. It is imperative that these indicators be tracked and that the projections be modified annually. These projections were carefully benchmarked to known data in 1990 (e.g. actual births, deaths, and estimated migration for the 1990-1995 period).

Interpolation.

The tables containing age distributions include entries for the years 1991-1994 and 1996-1999. These estimates were derived by calculating the compound annual growth rate between 1990-1995 and 1995-2000 respectively. This calculation was done separately for each age group, and the totals reflect the sum of the results not the interpolated total.

Notes.

The latest Federal-State-Local Cooperative program estimates through 1998 have been accepted by the Consortium and are reflected in the estimates. Those estimates were used primarily to adjust the 1995 projection and to influence the 2000 projection. In addition, the 1998 age distribution for Delaware estimated by the Census Bureau influenced these projections but was not adopted in its entirety.

There were a number of changes made to the employment projections. First, the overall estimates were increased even further as the economic continues to expand. Second, the distribution of total employment between counties was adjusted to reflect the 1990 Census data and self-employment estimates also incorporate the latest information from the Census and the Current Population Survey for 1997 and 1998.

Net commuting has been adjusted to reflect information found in the detailed county to county Journey to Work data recently provided by the Bureau of Census. This was refined by the Census Transportation Planning Package when it was released.

It should also be noted that the population of Newark was adjusted upward by the Census Bureau to correct an error in the geographic assignment of the group quarters population in census tract 143, block 901B. The official 1990 population count for the City of Newark, Delaware is 26,463. The 1990 total in this document now reflects this adjustment and age-sex data have also been adjusted.

The Bureau of Census recently released the county-to-county migration data derived from the 1990 Census. In 1990, people were asked where they lived in 1995. Using this information, it was possible to measure the flow of people by age and sex who moved into and out of each county in Delaware and the state as a whole. These data allowed the Consortium to review its assumptions on net-migration which had previously been estimated indirectly. The net effect of these adjustments was a reduction in the 0-4 age group which show net out-migration, and a slight reduction in the in-migration of the 65 and older population. In contrast, migration was higher in the 25-44 age groups which allowed an increase in the number of workers in the State. This information helped resolve some conflicting information in the school age population, the size of the labor force, and the estimates of the over 65 population reported receiving Medicare.

Finally, there are several categories on the summary page for the State and each county that require some definition:

Population Change - The net increase (decrease) in persons over the previous five years;

Births - The total number of births over the previous five years;

Deaths - The total number of deaths over the previous five years;

Net Migration - The total number of persons moving into the area less the number of persons leaving the area over the past five years;

Household Change - The net increase (decrease) in households over the past five years which is indicative of the number of housing units required;

Jobs by Residence - The number of jobs held by the employed persons for the projected period which will include the jobs of persons who hold more than one job;

Resident Jobs-1 - The number of jobs held by civilians living in the area for the projected period excluding self-employed, private household workers, and those directly working on farms estimated through the population projections.

Jobs by Place of Work - The number of jobs held by civilians working in the area for the projected period excluding self-employed, private household workers, and those directly working on farms;

Net Commuting - The number of persons coming into the area to work each day less the number of persons leaving the area to work each day during the projected period;

Resident Jobs-2 - The number of jobs held by civilians living in the area for the projected period excluding self-employed, private household workers, and those directly working on farms estimated through the employment projections.

Census County Divisions (CCD's)

There are 27 Census County Divisions (CCD's) in Delaware. Each is a grouping of related census tracts within each county. Eleven CCD's are found in New Castle County with seven in Kent County and nine in Sussex County. The population of a CCD can vary considerably from as low as 5,000 to almost 80,000 people. Some are extremely rural and others are heavily populated. Despite this variation, they conveniently divide each county into meaningful geographic areas.

The importance of doing sub-county projections is clear when growth patterns are uneven within a county. For example, the northern CCD's in New Castle County have been largely stable or declining in population. In contrast, the lower density areas in the southern CCD's have been exploding. Planners and policymakers must consider these different propensities as they look to the future.

The approach to projecting population for sub-county areas has to differ from the more conventional demographic methods that employ births, deaths, and net-migration. The small populations make the rates inherently unstable and there can be wide swings in migration rates when compared to those experienced at the county level.

The projections developed here consider two different datasets. First, the thirty-year pattern of population change (positive and negative), the rate of housing unit construction, and the change in household size is considered. These rates are also examined for the past ten years and the most recent five years to see if these rates have been increasing, decreasing, or stable, at least with respect to other CCD's in each county. In general, more recent growth rates are more heavily weighted than those in the past although the long-term rate does still have an impact.

The second dataset is each county's property assessment database. These databases were examined for land absorption rates and subdivision rates. For the period 1994-1998 an analysis of changes in landuse within each CCD was conducted. The net change in improved residential properties (suitably adjusted for vacation homes in Sussex County), the net change in unimproved residential lots, and the net change in acres of residential land all were used in developing the projections that follow in this section.

Using all these factors, the additional population for the county over each five-year period was allocated to the most likely CCD's. After the population was allocated, the number of additional households was calculated using the existing household size for the CCD-time period combination. In all cases the result was controlled to the county total.
