REFERENCE NOTES

DEFINITIONS

MONTHLY DEGREE DAY TOTALS: One heating (cooling) degree day is accumulated for each degree that the daily mean temperature is below (above) 65 deg. F

WIND: (As shown in "Evaporation and Wind" table) The total wind movement in miles over the evaporation pan as determined by an anemometer recorder located 6-8 inches above the pan.

NORMALS: The average value of the meteorological element over the time period - 1951-1980. The normals for National Weather Service localities have been adjusted so as to be representative for the current observation site.

DIVISIONS: Areas within a state of similar climatological characteristics. Division averages are calculated using data from stations that record both temperature and precipitation (ie: not precipitation alone).

STATION NAMES: Name of the city, town or locality. Figures and letters following the station names indicate the distance in miles and direction from the post office or town community center.

SYMBOLS AND LETTERS USED IN THE DATA TABLES

- No record. Data not recorded, determined unreliable by quality control checks, or not received in time for publication.

* Rain gage not read. Precipitation is included in the amount following the asterisks. Time distribution not known.

// Rain gage equipped with a windshield.

A Amount of precipitation is the total of observer's entries for the current month. It may include precipitation that occurred during the previous month. Refer to monthly bulletins to determine date of last reading. (HAWAII stations)

B Estimated total value for wind, evaporation, or cooling degree days.

M Insufficient or partial data. M is appended to average and/or total values computed with 1-9 daily values missing. M appears alone if 10 or more daily values are missing.

R Amounts from recording rain gage.

T Trace. An amount too small to measure.

V Includes total for previous month(s). (See * above)

Z Same as M but the Z has overprinted a Negative sign or leading digit (eg. Z14.6 = M-14.6, Z08.2 = M108.2).

SYMBOLS AND LETTERS USED IN THE STATION INDEX TABLE

Thermometers located in a rooftop shelter.

C Station is equipped with recording rain gage (R) but values in this bulletin are from a non-recording rain gage unless indicated by an R.

G Observations appear in "Soil Temperatures" table.

H Observations appear in "Snowfall and Snow on Ground" table in Monthly Climatological Data publications.

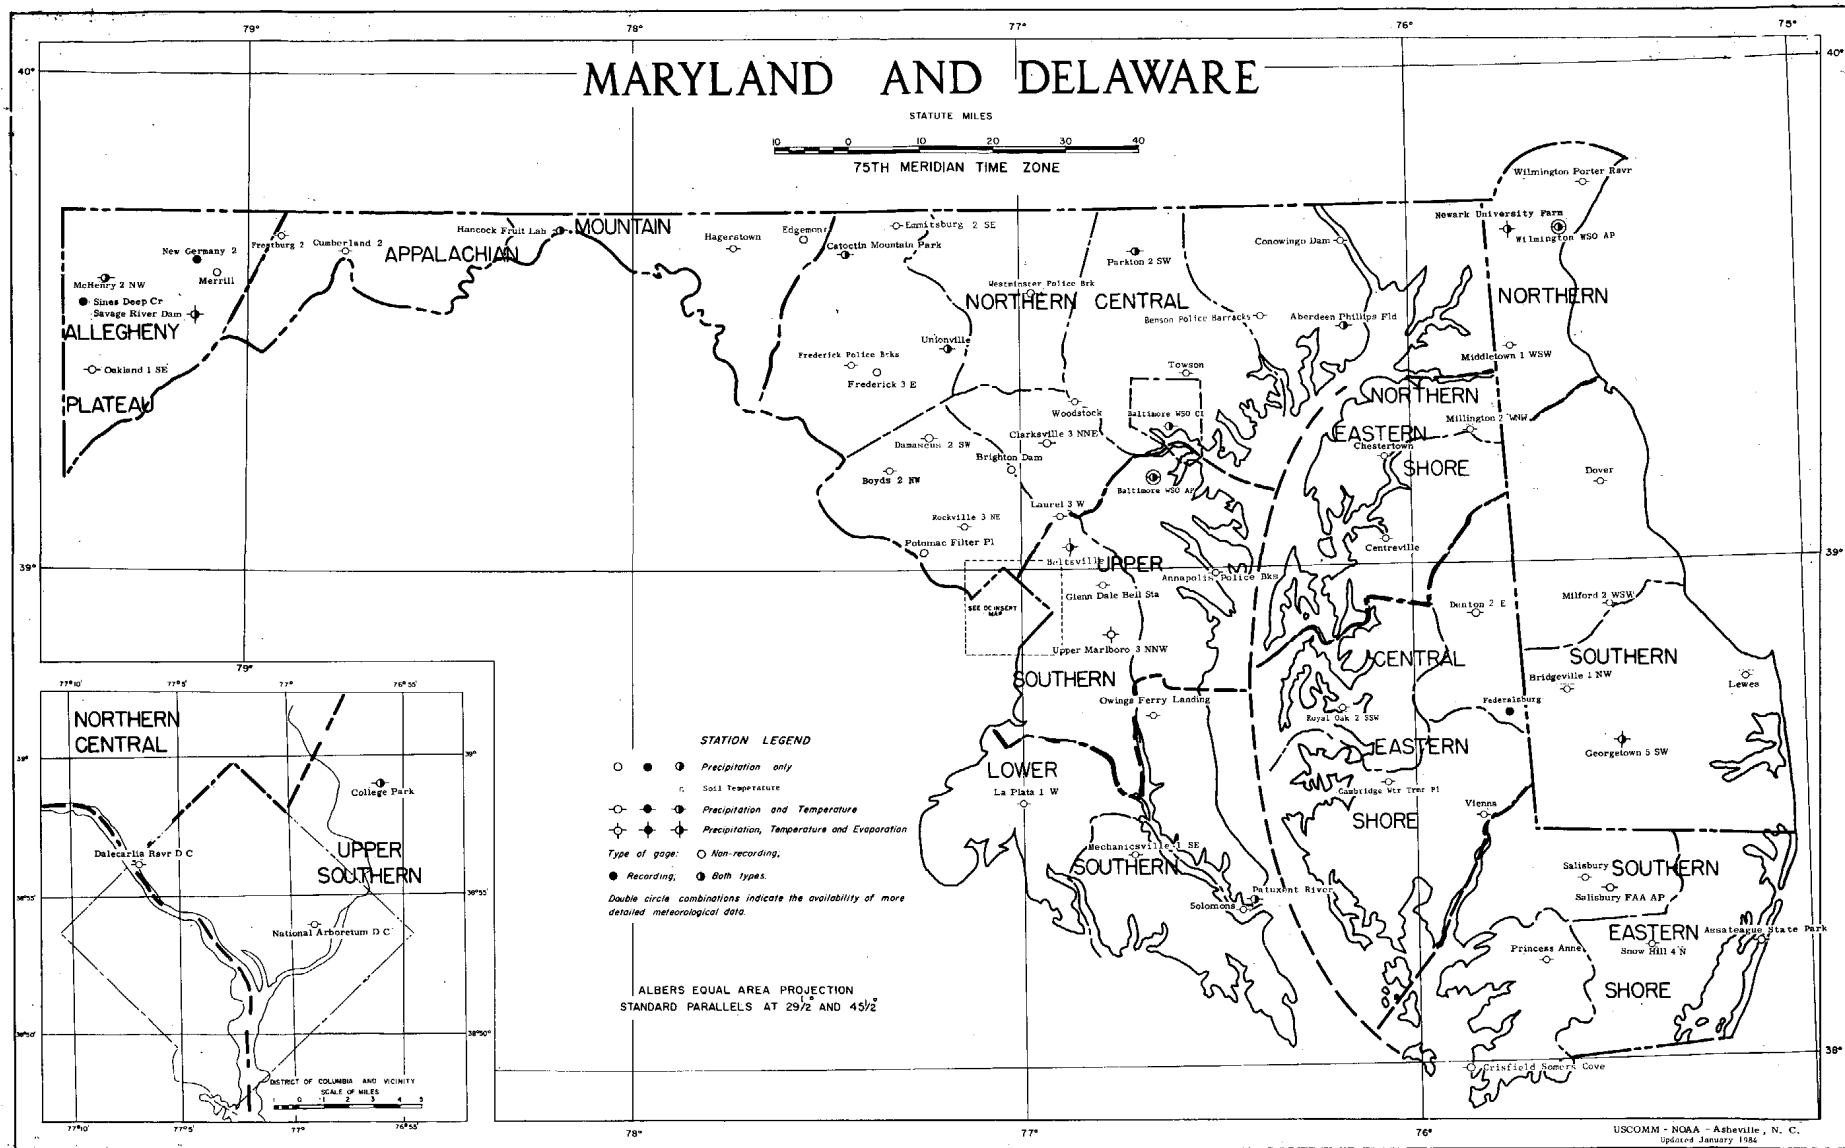

J Station also published as a "Local Climatological Data" publication.

Additional Information regarding the climate of this state may be obtained by writing to the National Climatic Data Center, Federal Building, Asheville, N.C. 28801-2696, or to any Weather Service Office near you. Additional precipitation data are contained in the "Hourly Precipitation Data" bulletin for each state, except Alaska.

Seasonal Tables: Monthly and seasonal snowfall and heating degree days for the 12 months ending with the June data will be carried in the July issue of this bulletin. Cooling degree days for the calendar year will be published in the "Climatological Data Annual Summary".

Information concerning the history of changes in locations, exposure, etc. of substations through 1955 is available in the "Substation History" publication. Subsequent historical information is kept on file at the National Climatic Data Center. Similar information for regular National Weather Service Offices may be obtained from the "Local Climatological Data" annual publication.

SUBSCRIPTION, PRICE AND ORDERING INFORMATION AVAILABLE FROM:
THE NATIONAL CLIMATIC DATA CENTER, FEDERAL BUILDING,
ASHEVILLE, N. C. 28801-2696.

1984 DROUGHT INDICES

The 12 maps on the following pages depict monthly values, for 1984, of the Palmer Moisture Anomaly (Z) Index. Data are presented for each climatic division in seven categories of drought delineated by various thresholds of drought and wetness. The maps serve to illustrate the spatial and temporal variability of drought across the U.S. in 1984. The "Z" index, reflecting short-term moisture deficiencies or excesses, has been shown to be well-related to some crop yields. It emphasizes the moisture availability in the top-soil rather than long term water storage which is more difficult for crops to obtain. A "Z" index value of 4.0 (extremely wet) can theoretically occur in the midst of a long-term drought.

LONG TERM DROUGHT INDICES

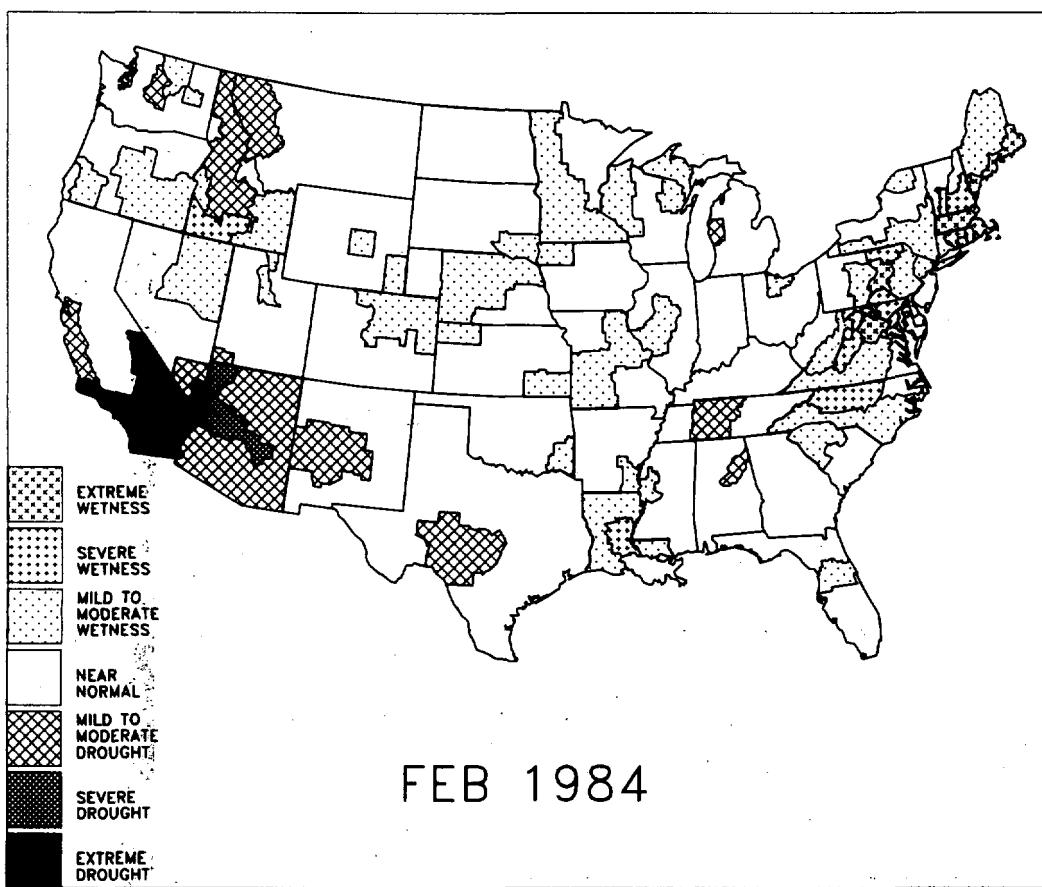

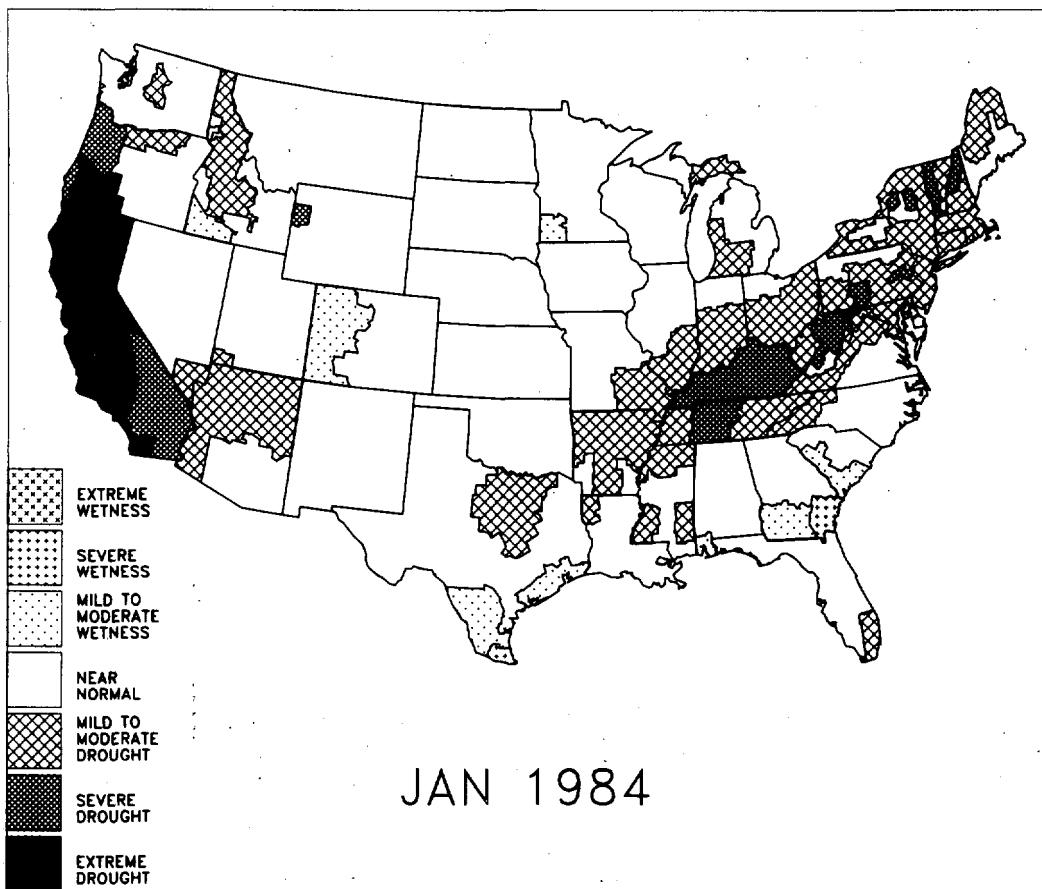

1895 - 1983

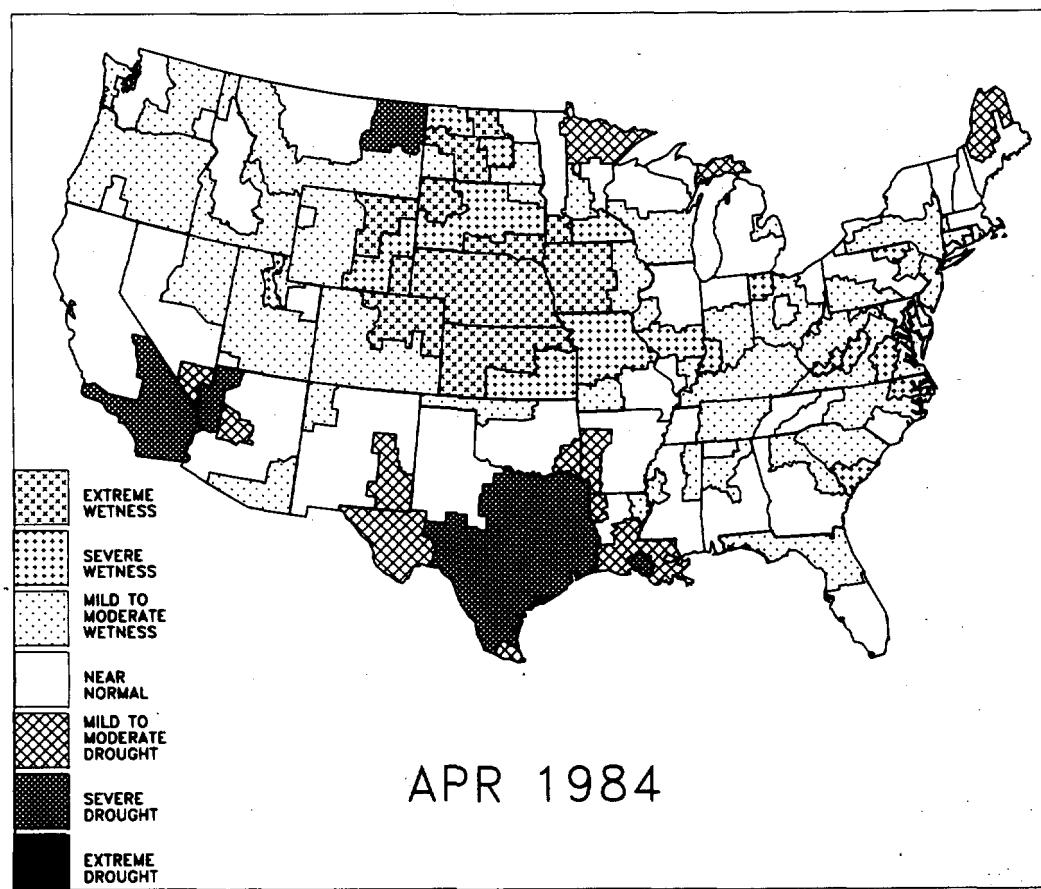

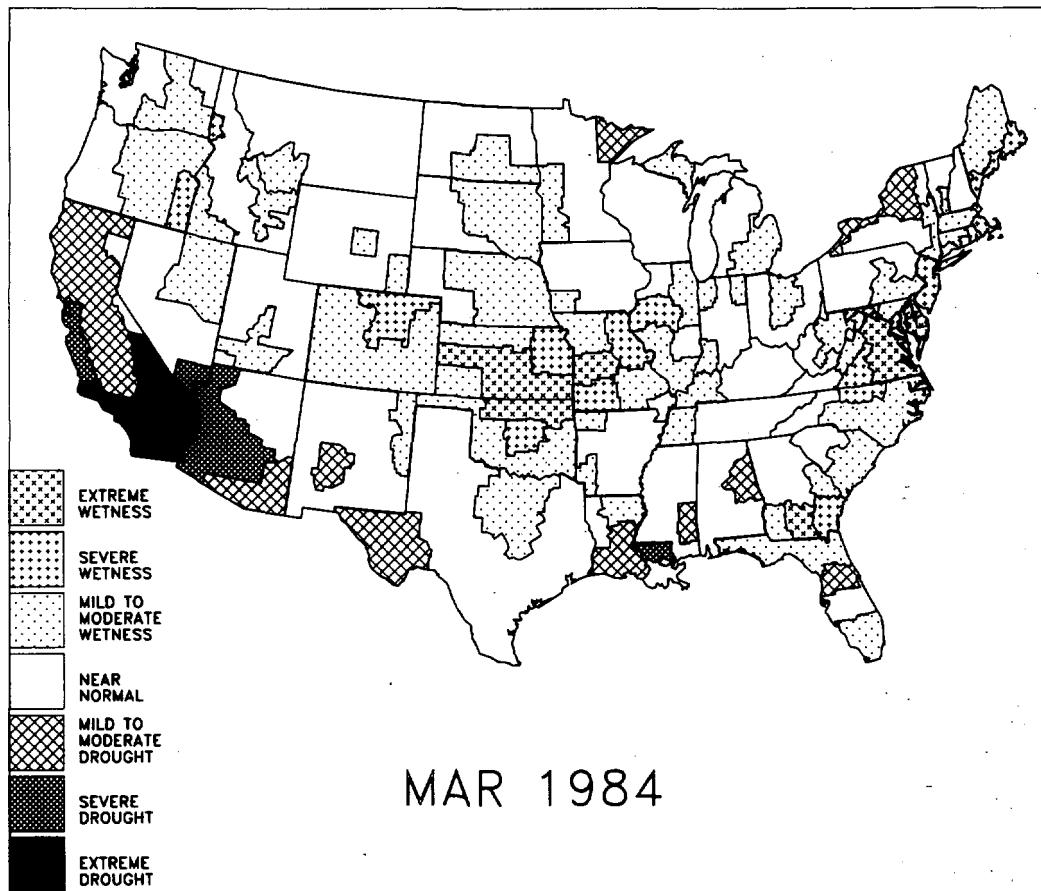

Historical maps of the "Z" index for the years 1895-1983 have been published by NCDC as the Historical Climatology Series 3-8 and 3-9. Similar maps depicting the Palmer Hydrological Drought Indices (PHDI) and Palmer Drought Severity Indices (PDSI) for 1895-1983 have also been published as Series 3-6, 3-7 and 3-10, 3-11, respectively. The PHDI is more appropriately related to long-term water storage such as ground water supply and lake and reservoir levels whereas the PDSI is more useful as a meteorological drought index classifying spells of weather.

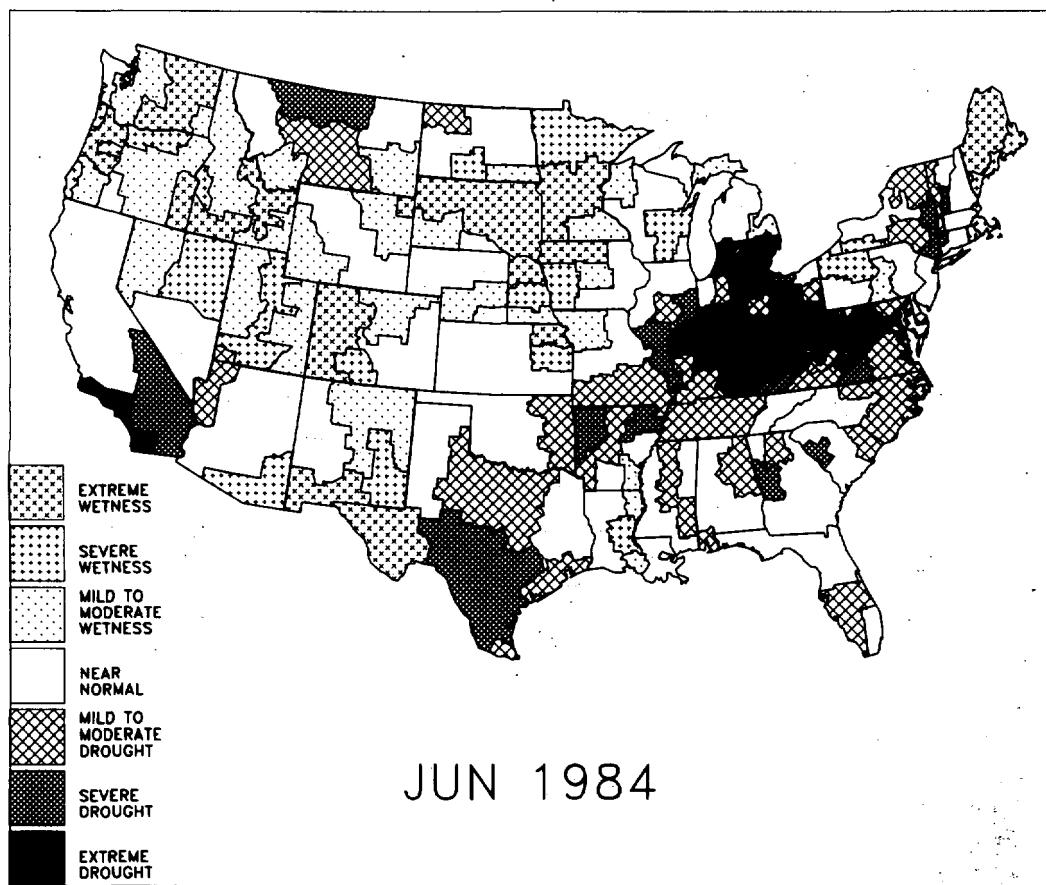

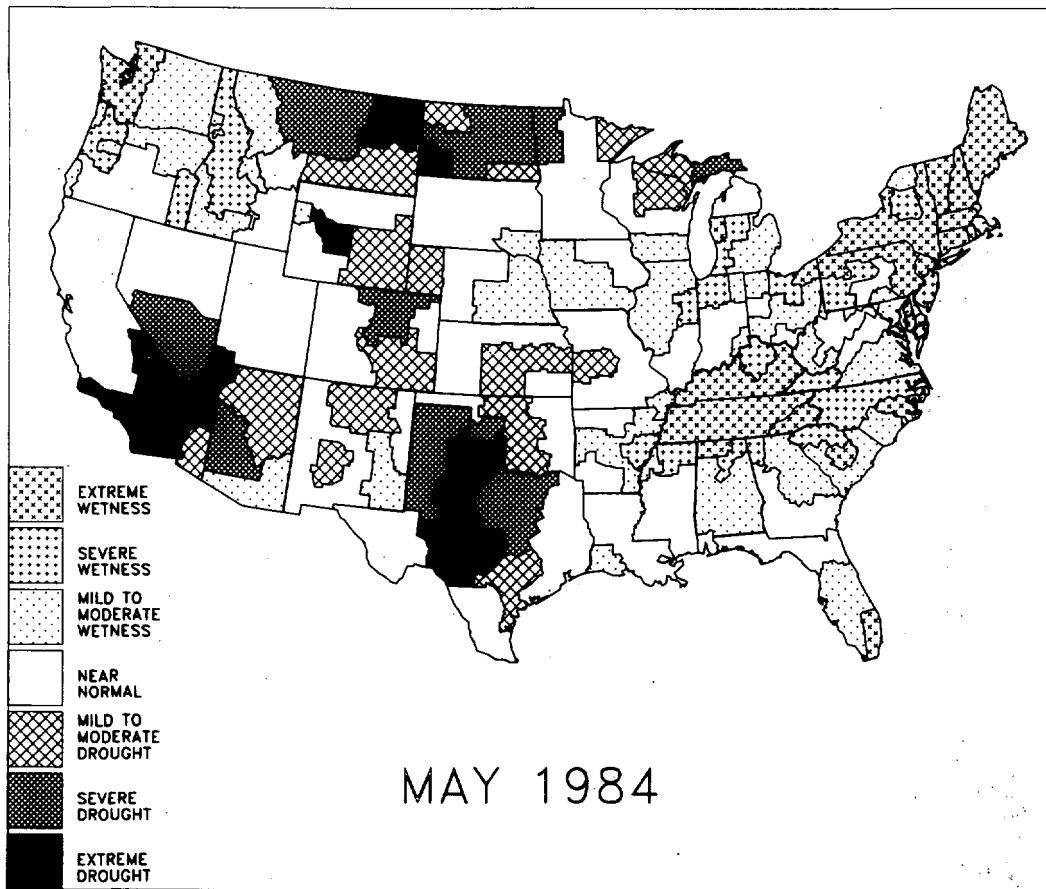

The maps contained in this series are the result of computer programs written by Richard W. Knight. The contents of the maps and the text were prepared by Thomas R. Karl. The data used in constructing this series are available in digital form.
