NOVEMBER 1953  
Volume LVII No. 11

MARYLAND AND DELAWARE - NOVEMBER 1953

G. N. Brancato, Section Director - Baltimore, Md.

WEATHER SUMMARY

A record early season snow for most of Delaware and most of the eastern and central portions of Maryland was the outstanding feature of November's weather. The month was the sixth in succession in which precipitation averages were below normal for the Section as a whole. Temperatures for the month averaged slightly above normal in Maryland and normal in Delaware. Sunshine was near normal and the average speed of the wind was below normal.

On November 5th, a large mass of cold air was over the eastern part of the United States and Canada. A system of low barometric pressure, moving northeastward along the Atlantic Coast, became almost stationary off the middle Atlantic Coast and increased in size and intensity. By the morning of November 6th, snow was falling in practically all portions to the east of South Mountain, except that warmer temperatures near the Atlantic Ocean made the precipitation fall as rain. As the storm continued to intensify on the 6th, portions of the Delmar Peninsula where rain was falling saw the precipitation change to snow and the snow belt moved westward into the mountains. The snow continued through most of the night of the 6-7th. The greatest amount reported in Maryland was 14 inches at Elkton but amounts almost one foot deep fell in most northern Maryland Counties as far west as the eastern portion of Washington County, and in Queen Annes and Kent Counties. The greatest depth in Delaware was 11.9 inches at Wilmington New Castle Airport, with amounts up to ten inches being reported as far south as Dover. Accompanied by wind gusts of thirty miles per hour and higher, the snow drifted and most highways in northern Delaware and northern and northeastern Maryland were closed. Except in southeastern Maryland and west of Hagerstown, new records for snow so early in the season were established. Also, at many stations new records for the entire month of Novem-

ber were established. Where the snow drifts were deep, it was two weeks before they melted away. Due to these snows, monthly totals for the Section were several times normal amounts. Relatively little snow was reported after the 7th, practically all in western Maryland. In Delaware and Maryland, monthly averages of snowfall were the second highest ever recorded in November and were exceeded only in 1938.

November precipitation was below normal in all areas except southeastern Maryland and the southeastern portion of Sussex County, Delaware. In Delaware, monthly totals varied from 4.35" at Millsboro to 1.17" at Bridgeville, while Maryland totals ranged from 3.54" at Berlin 2 NE to 0.69" at Luke. Although the snow and rain of November 6-7 provided the greatest one-day precipitation for some stations, the heaviest precipitation was recorded on the 23rd at most stations. Only about one-third of the greatest one-day precipitation amounts exceeded one inch. The dryness in most of the Section delayed the preparation of the ground for the seeding of winter grains. The supply of water in wells and streams decreased further during the month.

Temperatures averaged near normal for November and there was little variation in the deviation from normal over the Section. In Delaware, mean temperatures varied from 48.0° at Millsboro to 44.5° at Newark College Farm, and in Maryland the same data ranged from 51.2° at Crisfield to 38.3° at Sines Deep Creek. Extreme readings in Delaware were 76° at Bridgeville, Laurel 2 SW, and at Milford on the 3rd and at Laurel on the 19th, and 14° at Newark College Farm on the 8th. Maryland extremes were 83° at Unionville on the 3rd and 13° at Oakland on the 11th. It was mild during the 1st-4th and during the 15th-25th, while below normal temperatures prevailed during the 5th-14th and the 26th-29th. - H.L.A.
